Reference	INT001
Version	1
Updated	20/08/25
Author	James Brodrick
Owner	Chief Technology Officer

Change History

August 20th, 2025

- Initial Draft

Introduction

This document and accompanying materials will help you quickly integrate with the Valifi Equifax Real Time Historic Auto Loans API.

The Historic Auto Loans API is intended to replace the original batch service, enabling your firm to retrieve historic loans at the same time as the CZ credit report is requested, without having to wait >24 hours for the batch to complete.

1. Postman Collection
2. Typical Customer Journey and Flow
3. Authentication
4. Address Lookup
5. CZ Search
6. Summary Report

7. Summary Report V2

Postman Collection

A Postman collection will be provided alongside this integration document to help you interact with the Valifi platform UAT environment.

Modify the collection variables with your provided username and password.

Typical Customer Journey and Flow

Customer Journey

1. Visits your landing page
2. Enters name, address and date of birth
3. Asked to verify identity
4. Verify with either KBA or OTP + Mobile
5. Presented with a list of HP agreements
6. Capture contact details, e-sign etc.

Application Flow

1. Capture name, date of birth and postcode
2. Pass your credentials securely to the Valifi authentication endpoint
3. Retrieve an access token that will be used with every subsequent request
4. Optionally pass the postcode to Valifi API for list of matched addresses
5. Allow customer to pick the correct address
6. Pass the address or address ID to the KBA / AML or OTP + Mobile ID / AML endpoints
7. Capture any AML or verification data that you require
8. Pass the same address to the CZ search endpoint

9. Analyze the credit file and **summary report to identify historic agreements** from over 6 years ago

Authentication

Refer to the Readme document for information on how to authenticate before making subsequent API requests.

Address Lookup

This remains unchanged, refer to the Equifax Credit Report Integration.

CZ Search

The request and CZ response remain largely unchanged. Please refer to the Equifax Credit Report Integration for details.

Behind the scenes, Historic Auto Loans works on a separate API endpoint from the CZ search. However, Valifi has integrated the API into the CZ search request, making it a single seamless API call. The CZ raw credit file will remain unchanged, and the additional credit agreements can be found within a new summary report that follows a nearly identical pattern to the existing summary report. **The new "Summary Report V2" needs to be requested with "includeSummaryReportV2":true**

Post: <https://staging-app.valifi.click/bureau/v1/equifax/cz>

Request

```
{
  "includeJsonReport": true,
  "includePdfReport": false,
  "includePdfSummaryReport" : false
  "includeSummaryReportV2":true,
  "includeSummayReport": false,
  "clientReference": "test2",
  "title": "",
  "forename": "MIHAI-ADRI",
```

```
"middleName": "",
"surname": "SPOUGE",
"dateOfBirth": "1956-11-04",
"currentAddress": {
  "flat": null,
  "houseName": null,
  "houseNumber": "14",
  "street": "asas",
  "street2": null,
  "district": null,
  "postTown": "",
  "county": null,
  "postCode": "CB6 1AS"
},
"previousAddress": null,
"previousPreviousAddress": null
}
```

Response

The response can include three components: the raw credit report in JSON format, a summary report, the **summary report v2 (including historic loans)**, a PDF version of the raw credit report, a PDF of the summary report.

Summary Report / Summary Report V2

Both the initial request for a CZ report and the subsequent retrieval of a previous report, can include a summary report by passing in `includeSummaryReport: true` and **`includeSummaryReportV2: true (to retrieve historic loans)`**.

In most cases, the summary report will be the preferable data to retrieve and work with. The **summaryReportV2 must be interrogated to retrieve the historic motor agreements.**

The summaryReportV2 follows the same pattern as the original summary report, with a few key additions, enabling you to extract the historic auto loans in real time. This allows you to review both the original and v2 reports, batch process and new API side by side until your firm is comfortable with the results returned. Key additions include:

1. The only change to the request is the addition of **"includeSummaryReportV2":true**
2. Addition of summaryReportV2 block to the response
3. summaryReportV2 will include the familiar accounts block, which remains unchanged and contains a deduplicated list of accounts across the CZ search, batch process, and the new Auto Loans API. Any accounts in the accounts section retrieved from the Auto Loans API will be flagged as "sourcedFrom": "AUTO_API"
4. summaryReportV2 will include an autoApiAccounts block, showing a complete list of accounts found in the API (not deduplicated)
5. summaryReportV2 will include a batchAccounts block, showing a complete list of accounts found in the Batch (not deduplicated)
6. summaryReportV2 will include a czAccounts block, showing a complete list of accounts found in the CZ search (not deduplicated)

Example

```
{
  "status": "true",
  "data": {
    "id": "84e94b4f-f675-4d20-bb3b-24caa76277aa",

```
}  
}  
}
```

Summary Report V2 Notes

- The report contains a summary that makes it easier to check the total motor finance accounts found across both the CZ search, batch and the new Auto Loans API.
- **totalAccounts:** Total unique accounts across both CZ search historic batch, and historic API
- **hpAccounts:** Number of PCP/HP accounts in the total
- **leaseAccounts:** Number of lease accounts in the total
- **totalInCzReport:** Number of accounts found in the initial CZ search
- **totalInBatch:** Number of unique accounts found in the historic batch report after deduplication
- **totalInOriginalBatch:** Number of accounts found in the historic batch report before deduplication
- **totalInAutoApi:** Number of unique accounts found in the auto api after deduplication
- **totalInOriginalAutoApi:** Number of accounts found in the auto api before deduplication
- **accounts:** List of unique accounts found
- The address can include an **addressName** and/or **addressNumber**, which are omitted if undefined
